

# Keyboard Shortcut Cheat Sheet Overlay

Rainy Music Player — Feature Testing Document

---

## Feature Description

A full-screen overlay that lists every keyboard shortcut available in Rainy, organized into logical groups (Playback, Volume, Player, Speed, Search & Navigation, General). It is toggled by pressing the **?** key and can be dismissed with **Esc**, a backdrop click, the close button, or pressing **?** again. The overlay is built as a self-contained module (`static/js/modules/shortcutOverlay.js`) following the same pattern as the existing Global Search overlay.

## Why It Was Added (User Benefit)

Rainy has accumulated many keyboard shortcuts (play/pause, seek, volume, mute, fullscreen, like, A-B repeat, playback speed, equalizer, search). New and casual users have no way to discover them without reading source code. A discoverable, always-available cheat sheet lowers the learning curve, speeds up power-user workflows, and reduces the need to memorize keys — improving the overall listening experience.

## Step-by-Step Testing Instructions

1. Open Rainy in a browser and log in so the player loads.

*Expected:* The app loads to the library view with no console errors.

2. Press the **?** key (Shift+/ on most keyboards).

*Expected:* The shortcut overlay appears centered on screen with a dimmed, blurred backdrop and a smooth slide-in animation.

3. Verify the overlay shows six groups: Playback, Volume, Player, Speed, Search & Navigation, General.

*Expected:* All groups render in a two-column grid, each with an icon, uppercase title, and a list of key/action rows.

4. Confirm specific shortcuts are listed correctly (e.g. Space = Play/Pause, M = Mute, F = Fullscreen, Ctrl+K = Global search, ? = Toggle this sheet).

*Expected:* Each row shows styled `<kbd>` key caps and a right-aligned action description; multi-key combos show a '+' between caps.

5. Press **?** again while the overlay is open.

*Expected:* The overlay closes (toggles off).

6. Reopen with **?**, then press **Esc**.

*Expected:* The overlay closes via the Escape handler.

7. Reopen with **?**, then click the dimmed backdrop outside the panel.

*Expected:* The overlay closes via the backdrop click handler.

8. Reopen with **?**, then click the X close button in the header.

*Expected:* The overlay closes.

- 9.** Click into the search input (or any text field) and press ?.

*Expected:* The '?' is typed into the field and the overlay does NOT open (shortcut is suppressed while typing).

- 10.** Open the Global Search overlay (Ctrl+K) and the shortcut overlay, then press Esc.

*Expected:* Esc closes the top-most overlay first without errors.

- 11.** Resize the browser window to a narrow width (under ~600px).

*Expected:* The overlay switches to a single-column layout and remains fully readable / scrollable.

- 12.** Reload the page and press ? again.

*Expected:* The overlay still works after a fresh load (module re-initializes on DOMContentLoaded).

## Edge Cases to Check

- Rapidly pressing ? multiple times should cleanly toggle open/closed with no duplicate overlays in the DOM (only one #shortcut-overlay element).
- Opening the overlay while a popup menu (sleep timer / speed / equalizer) is open should not break either; both should coexist or close gracefully.
- The overlay must not capture focus away from an active audio playback — pressing Space while the overlay is open should still toggle play/pause (verify no regression).
- On a keyboard where ? requires Shift, ensure the key event is still detected (e.key === '?').
- Verify no horizontal overflow / clipping on the panel at various zoom levels (50%-200%).
- Confirm the overlay z-index (4000) sits above player menus (z-index 3000) but does not block the login/setup screens on first load.
- Check that the backdrop blur renders on supported browsers and degrades gracefully (solid dark overlay) where unsupported.
