

Playlist Export (M3U / CSV)

Feature Description

Adds two new options to the playlist settings dropdown: **Export as M3U** and **Export as CSV**. M3U export produces an extended M3U file (#EXTM3U with #EXTINF metadata) containing full file paths, compatible with VLC, foobar2000, Winamp, and most desktop/mobile players. CSV export produces a spreadsheet-friendly file with columns: Title, Artist, Album, Duration, Genre, Year, and File Path.

Why It Was Added

Users often need to move playlists between apps or create backups. M3U is the universal playlist interchange format — exporting lets users open their Rainy playlists in VLC, foobar2000, MusicBee, or any other player without manual re-creation. CSV export enables spreadsheet analysis, sharing track lists, or importing into other services. This fills a gap where the only existing option was downloading the actual audio files as a ZIP.

Step-by-Step Testing Instructions

1. Open Rainy in a browser and log in.

Expected: You see the main library view.

2. Navigate to any playlist that contains at least 3 songs.

Expected: The playlist view loads showing the song list.

3. Click the three-dot (⋮) playlist settings button in the section header.

Expected: A dropdown menu appears with options: Edit Icon, Rename, Download Playlist, Export as M3U, Export as CSV, Delete.

4. Click 'Export as M3U'.

Expected: A file download begins. The file is named after the playlist with a .m3u extension (e.g., 'My Playlist.m3u').

5. Open the downloaded .m3u file in a text editor.

Expected: The first line is '#EXTM3U'. Each song has a '#EXTINF:', - ' line followed by the full file path.

6. Open the .m3u file in VLC or another media player.

Expected: The player loads all songs from the playlist in the correct order.

7. Go back to Rainy, open the same playlist settings dropdown, and click 'Export as CSV'.

Expected: A file download begins with a .csv extension.

8. Open the CSV file in a spreadsheet app or text editor.

Expected: The first row is the header: Title, Artist, Album, Duration, Genre, Year, File Path. Each subsequent row contains the song metadata.

9. Test with an empty playlist (create one, don't add songs, try to export).

Expected: An error toast or message appears: 'Playlist is empty'. No file is downloaded.

10. Test with a playlist whose name has special characters (e.g., 'My ■ Playlist!').

Expected: The downloaded filename is sanitized to only safe characters (e.g., 'My Playlist.m3u').

Edge Cases to Check

- Playlist with songs that have missing metadata (no artist, no album, no genre) — CSV should show empty strings, M3U should show 'Unknown Artist - Unknown Title'.
- Playlist with a very long name — filename should be truncated/sanitized without breaking the download.
- Private playlist owned by another user — export should return 403 Forbidden.
- Non-existent playlist ID (manually navigate to /api/playlists/99999/export) — should return 404.
- Playlist with songs whose file paths contain spaces or unicode characters — M3U paths should be preserved correctly.
- Rapidly clicking export multiple times — should not cause server errors or duplicate downloads.
- Export while not logged in (cleared session) — should redirect to login or return 401.
